

# PECO In-Home Assessments — LOCATING Money & Energy Savings OPPORTUNITIES

An energy audit helps identify areas in your home where you could be losing energy and money. Air leaks can have a negative impact on a home's comfort, temperature and efficiency. The biggest impact comes from warm air leaking out of your home during winter and into your home during summer. While doors and windows can be problem areas, air more often escapes through the attic, interior walls, electrical outlets and lighting fixtures.

## PECO In-Home Assessments can help by conducting a comprehensive whole-home review.

Our energy advisor will visit your home to help identify energy-saving opportunities that can make your home more efficient, which includes performing a blower door test. A blower door is a powerful fan that mounts into the frame of an exterior door. The fan pulls air out of the house, lowering the air pressure inside. Outside air then flows in through all unsealed cracks and openings, helping the advisor locate and quantify your home's air leakage.

To remedy the issue, both insulation and air sealing should be installed together to improve the home's performance, comfort, air quality and savings!

Your energy advisor will make energy-saving recommendations, provide a list of participating contractors and inform you of additional rebates for which you may qualify.
